

Marketing Campaign Performance & Data Analytics Report

Date: April 27, 2026

Reporting Period: March – November 2023

Status: Final Analysis

1. Executive Summary

This report details the performance of marketing activities over a nine-month period, encompassing **14.6 million impressions** and **£1.73 million in total revenue**. The overall campaign health is exceptional, yielding a **Return on Ad Spend (ROAS)** of **10.61x**. While growth momentum is positive, the data reveals a critical performance disparity between device types and a non-linear relationship between budget allocation and conversions.

Marketing Campaign Analytics - Executive Dashboard

2. Core Performance Metrics

The following high-level KPIs represent the aggregate success of the campaigns during the analyzed period:

3. Channel & Campaign Segmentation

3.1 Channel Efficiency

Analysis confirms that while Facebook provides the greatest reach, **Pinterest** is the most efficient driver of value.

- **Pinterest:** Achieved a **Median ROI of 2,318%** and the lowest Cost per Conversion (£3.13), which is 43% more cost-effective than Facebook.
- **Instagram:** Maintains the highest Engagement (CTR: 0.01419%) and serves as a balanced mid-funnel channel.
- **Facebook:** Leads in volume but requires optimization, as its Cost per Conversion (£7.65) is the highest portfolio.

3.2 Time Series Performance

The **Fall Campaign** emerged as the primary revenue driver, peaking in September with an 81% growth in impressions.

- **Fall:** 13,987 Conversions | £659,595 Revenue
- **Spring/Summer:** Average of ~12,600 Conversions per season.

4. Technical & Statistical Analysis

4.1 Device Performance Gap (Critical)

A rigorous statistical audit identifies a significant performance delta between Desktop and Mobile users.

- **Desktop CVR:** 89.4%
- **Mobile CVR:** 35.9%
- **Statistical Significance:** $p < 0.001$ (Highly Significant)

Insight: The 53.5-point gap suggests a technical friction point in the mobile checkout flow or a non-responsive landing page experience.

4.2 Correlation & Regression Findings

- **High Predictability:** Impressions to Clicks ($r = 0.787$) shows that ad creative and targeting are well-aligned.
- **Budget Inefficiency:** The correlation between Spend and Conversions is nearly flat ($r = 0.063$). This indicates that simply "throwing money" at the current strategy does not guarantee more sales; budget is likely being wasted on high-frequency, low-intent segments.
- **Variance:** The Regression model ($R^2 = 0.026$) suggests that 97.4% of conversion drivers are currently "unknown" factors (e.g., external seasonality, price changes, or brand sentiment) not captured in the primary spend data.

5. Strategic Recommendations

Immediate Technical Actions

1. **Mobile UX Sprint:** Conduct a full audit of the mobile checkout funnel. The $p < 0.001$ significance of the device gap confirms this is not a random fluctuation but a systemic failure.
2. **Ad Format Pivot:** Shift focus on **Collection Ads**, which currently outperform standard discount ads by **18.6% in CTR**.

Budgetary Reallocation

1. **The Pinterest Opportunity:** Double the budget for Pinterest campaigns to capitalize on the £3.13 conversion cost and high AOV.
2. **Facebook Optimization:** Reduce spending on broad Facebook reach and reallocate to retargeting segments to lower the £7.65 CPA.

Future Strategy

1. **Scale the "Fall" Blueprint:** Analyze the creative assets used in September 2023 to replicate that 81% growth spike in upcoming quarters.
2. **Attribution Modeling:** Implement more granular tracking to identify the "unknown" factors currently responsible for the high variance in conversion value.
